In this presentation I will start with a real life practical example of a smart energy project like PowerMathing City. The project discussed in our recent published papers will be introduced. I will cover views on how in Europe we envision how smart energy systems materialize in the upcoming decade. One of the cornerstones is this development is the universal smart energy framework (USEF; www.usef.info) and I might include a peak preview on the latest development I am working on smart DC grids.
